## Multiple Digital Messaging Unit (MDMU)

The PagePac® Multiple Digital Messaging Unit (MDMU) is a paging system enhancement that provides automated pre-recorded messages. The MDMU permits the end user to program, store and play voice messages over the paging system as desired or needed. **Playback** of pre-recorded messages can be initiated by simply dialing a telephone code or can be activated by a dry contact closure such as a time clock. **Applications** include general announcements, advertising messages, alert tones or instructional messages for safety or emergency evacuation. **Messages** can also be pre-recorded in multiple languages. The MDMU stores up to 99 messages with a total record time of 3 minutes and 17 seconds.

### Applications

- **SCHOOLS** - provide bells or event signals
- **HOSPITALS** - announce visiting hours, emergencies, general announcements
- **RETAIL** - provide advertising announcements of sales or specials
- **AIRPORTS** - provide flight announcements and safety notices

Ideal with the PagePac® Plus Controller or use the PagePal® to interface with any single zone system.

### MDMU Features:

- Select individual zones or groups of zones
- First 6 messages can operate from contact closure or dial up
- Up to 8 messages in sequence
- Built in battery backup to protect saved messages
- Output is 600 ohm T/R and contact closure
- Input is a standard station port for programming messages or for sending a message by dial up
- Tape input can accept a message from a tape recorder
